AUTHOR: Preobrazhenskiy, N.I., Candidate of Physical and Mathematical Sciences, Docent

TITLE: High Speed Filming in Scientific Research

PERIODICAL: Vestnik vysshey shkoly, 1959, Nr 4, pp 6-8; (11A)

ABSTRACT: Speed and high-speed filming permits to show the actual picture of swiftly passing phenomena and to discover details which could not be traced by any other means. Filming often leads to a radical revision of established hypotheses. Films of this kind were utilized by the Chair of Physics of the USSR Institute of Mechanization and Electrification of Agriculture (MIMESKh) for studying the technological processes in the work of agricultural machinery. Four films were made in the operation with the Chairs for Repairing Soil Cultivation and Harvesting Machines. The first film - on the work of a plough - shows how the plough's body, with its working surface, affects the soil. After filming, the author states that the film confirmed his calculations on the working surface of the plough.

073-14-111

High Speed Filming in Scientific Research

Docent B.M. Shmelev and Assistant I.P. Geronimova, under the supervision of the Member of VASKhNIL V.A. Smolinovskiy, the second film dealt with the pneumatic cotton picker, the construction of which has many imperfections. The Member of Technical Science I.N. Georgiyev developed, under the supervision of Member of VASKhNIL I.F. Vasilenko, structural changes in the working organs of the machine and added a special device to shake the shrubs. The third film discloses the technological process of work of corncob tearing apparatus in 2A corn harvesting machines. The machines used at present require substantial improvement. A high-speed film was taken for a comparative survey of the present corn harvesting machine and of the new one designed in the Vsesoyuznyy nauchno-issledovatel'skiy institut mekhanizatsii i elektrifikatsii sovkhovov (VNIIES) (All-Union Scientific-Research Institute of Mechanization and Electrification of Sovkhozes) the work was conducted under the supervision of I.F. Vasilenko and Engineer Yu.A. Gyrdymov. It permitted to establish the cause and character of damage to the corncobs. The fourth film,

Card 2/3

High Speed Filming in Scientific Research

88/3-10-1-44 4c

taken in connection with the research of Engineer N. N. Avdeyev, shows the process of separating grain in a shaker of stationary threshing machines and grain harvesting combines. It was possible to establish the conditions most favorable for separating grain and to considerably cut the losses. Scientific-research filming is conducted in many vuzes and scientific institutes. But because of the poor organization of information, the work is done mainly on using the film in scientific and training work, with considerable difficulties. In this connection E. V. Zakharenko's book "Scientific Film Documents Prepared at the Yuzovskiy Institute from 1948 to 1957", [Ref 1] contains valuable information. There is 1 Soviet reference.

TITLE: Adapter for visual selection of transistors by means of the oscilloscope type EO-7

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 5, 1962, abstract 5-7-297 sh (V sb. Poluprovodnik, pribory i ikh primeneniye, no. 7, M., Sov. radio, 1961, 137 - 140)

TEXT: An adapter is described which, by means of the oscilloscope EO-7, permits to select transistors of identical parameters, types P13 - P16, P101 - P103, P401 - P403, P201 - P203 and P4. The following characteristics of transistors are verified:

$$i_{KD} = f_1(u_K), i_{KH} = f_2(u_K), i_K = f_3(u_K), i_k = f_4(i_8)$$

and 
$$i_k = f_5(i_9).$$

One part of the equipment serves for the first three equations, and Card 1/2

Adapter for visual selection of ...

S/194/62/000/005/153/157  
D271/D308

the other part - for the remaining equations. In the first case, collectors of the checked transistors, and in the second case - transistor inputs, are supplied from the secondary winding of a center-tapped transformer. Operation is based on sequential display of characteristics of both transistors during one period of the voltage supplying primary winding of the transformer. TEXT: Simultaneous observation on the screen of a CRO of the characteristics of two transistors is made possible by use of a special attachment, developed for this purpose, to the 30-7 (EO-7) oscilloscope. The attachment makes it possible to determine simultaneously for two transistors and for each of them (both of p-n-p and n-p-n types) the reverse collector currents  $I_{cr}$ , the zero-emitter collector currents  $I_{co}$ , the dependence of the collector current  $I_c$  on the collector voltage  $U_c$  at a constant base  $I_b$  or emitter

Card 1/2

Selecting transistors by ...

S/194/62/000/001/033/066  
D201/D305

current  $I_e$  and the dependence of the collector current on base or emitter current for constant collector supply voltage. The attachment consists of two independent units. The first unit is designed for observation of static characteristics:  $I_{cr} = f(U_c)$ ,  $I_{ce} = f(U_c)$ ,  $I_c = f(U_c)$  at  $I_b = \text{const}$  or  $I_e = \text{const}$ . A circuit for the observation of  $I_c = f(U_c)$  at  $I_b = \text{const}$  is given. The collectors are connected through potential dividers to the ends and to the center tap of the secondary winding of a transformer, so that 50 c/s pulsating voltages of opposite signs are applied to the collectors. The second unit of the attachment is designed for observing the dynamic characteristics  $I_c = f(I_b)$ ,  $I_c = f(I_e)$  at  $U_c = \text{const}$ . The circuit connection of the second unit, for observing  $I_c = f(I_b)$  is given. The base circuits are supplied from a transformer with a center-tapped secondary. The dynamic characteristics may thus be observed at a 50 - 500 c/s pulsating base current. / Abstracter's note: Complete translation. /

ABSTRACT: An induction sensor consisting of two transistor oscillators and a power transistor is briefly described. The operating 0.3-mm metal vane stops oscillations when it moves into a slot between two coils of one of the oscillators, and causes the final relay to operate. Reliable operation at an ambient temperature of -20 +75C with a supply voltage variation of -15 +10% is claimed. The sensor can be supplied by a 12/24 v unsmoothed d-c voltage taken from a rectifier. TOPIC TAGS: position sensor, transistorized position sensor

TRANSLATION: A position sensor<sup>25</sup> is considered whose operation depends on the collapse of oscillations of a transistorized oscillator. Tables are presented which show the effects of temperature, supply voltage, and transistor gain on the operating position. The operating-point shift at a supply voltage variation of  $-15 + 10\%$  remains within 0.3 mm with iron and copper vanes over 1 mm thick and 50 mm wide. The sensor operation is stable at temperatures within  $-20 + 75^{\circ}\text{C}$ . The sensor parameters are reported.

TITLE: Application of mathematical methods to the investigation of the impulse activity of brain central neurons

SOURCE: Biofizika, v. 8, no. 3, 1963, 387-393

TOPIC TAGS: central neuron impulse activity, mathematical methods, electronic computers

ABSTRACT: Before central neuron impulse activity can be programmed for electronic computers, mathematical methods must be developed to analyze it. This study formulated mathematical terms for the impulse activity of reticular brain neurons in a cat under chlorozole narcosis. Adrenalin and acetylcholine were used to change the rhythmic activity of the neurons. Two types of activities were measured by oscillograph: "background" and "induced". Background activity is cell activity without any stimuli which can be represented mathematically as a steady-state function of a random flow of uniform events taking place in a

Card 1/2

L 10118-63

ACCESSION NR: AP3001479

given time interval. Induced activity includes background activity as well as reaction to a controlled stimulus which is not of a random nature. The latter is expressed mathematically by superimposing a non-random function on the function of background activity. Formulas 1 to 8 show an approximation method for determining cell reaction to a stimulus. The method described by the authors makes it possible to find general cell responses to a stimulus, to find the degree of freedom in response (independent parameters which identically determine the response), and to calculate the values for these parameters. Investigation of impulse activity according to this system, even for one cell, is very time consuming, and therefore this method requires an electronic computer. Recently a universal algorithm for quantitative analysis of neuron impulse activity in an electronic computer was made. [Abstracter's note: No details given in regard to last statement.] Orig. art. has: 5 figures, 8 formulas.

TITLE: Boris Sergeyovich Uspenskiy (on his 60th birthday)

SOURCE: Elektricheskiye stantsii, no. 8, 1966, 95-96

TOPIC TAGS: hydroelectric power plant, electric engineering personnel

SUB CODE: 10

ABSTRACT: B. S. Uspenskiy was born in June 1906. He graduated from  
the State Electric Machine Building Institute in 1928 as an electric  
installation engineer. He worked in the State Electro-Technical Trust  
for four years, then in the All-Union ElectroTechnical Union, where he  
planned power construction units. Plans which he made up at that time  
for the electrical portion of electrical stations and sub-stations are  
still being used. He was involved in planning and installation of the  
electrical portion of hydro-electric power stations and powerful pumping  
stations in the Moscow-Volga Canal. During the war, he was in charge in  
installation of the Krasnogorskaya Heat and Electric Power Station, the  
planning of the Urals Hydro-Electric Power Station and other projects. #

TITLE: Transmission device of an overhead thrust conveyor. Class 81, No. 172231

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 12, 1965, 134-135

TOPIC TAGS: overhead conveyor, transmission, crane

ABSTRACT: This Author Certificate presents a transmission device of a suspended thrust conveyor. The device contains spring-supported vanes set in a rotary motion by a star wheel meshing with the drive chain of the conveyor (see Fig. 1 on the Enclosure). To prevent the possibility of wedging the carriage during its transport, the device is provided with a two-armed spring-supported lever. One of the arms serves as a stopper for the carriage, and the other one (provided with a roller) interacts with a circular template fixed on the star wheel. The template has openings for receiving the roller which frees the carriage from the stopper.

**F** 2333. TECHNOLOGICAL LAY-OUT FOR RECONSTRUCTION AND NEW COAL PREPARATION PLANT. Preobrazhenski, P. I. (Stal, 1948, (2), 107-116). A detailed survey is made of methods for coal preparation applicable to the types of coal used in the U.S.S.R. After a consideration of preliminary classification dust removal is dealt with, a flow sheet being given. Wet desludging and coal concentration are discussed, the variations of the latter process for different kinds of coal being illustrated by flow-sheets, and the dehydration of the products is considered. Particular attention is given to the operation of sedimentation plant, the following points being discussed: (1) The recovery and treatment of coarse sediment and of the sediment from the wet desludging process; (2) the concentration of fine sediments; (3) the recovery of water from the dehydration equation is given for the length of a settling tank in terms of time for settling, rate of flow of water, and the width of the tank.

khimicheskogo zavoda")

PERIODICAL: Koks i Khimiya, 1958, Nr 10, pp 15 - 17 (USSR)

ABSTRACT: The author criticises some of the conclusions and  
recommendations of the authors of the original paper.  
It is pointed out that the authors did not take into con-  
sideration changes which took place in the coal beneficia-  
tion technique from the time of designing the Yenakiyevo  
Beneficiation Plant which they quote as the most success-  
ful type of plant. He agrees with the original authors  
regarding defects in the installation of the equipment for  
treating slurries, pointing out that, at the time of  
designing the plant, jigs for slurries were not used and

**Salt-bearing formations of the western slope of the Ural mountains as a base for the salt-working industry.** *P.L. Preobrazhenskii. Byull. Inst. Halurgii 1938, No. 1, 47-60; KAIW. Referat. Zhur. 2, No. 3, 25(1939).*—The complex exploitation of the salt-bearing formations bounded by the western slope of the Ural mountains and the Kama and Volga rivers in the east is discussed. The presence of rich deposits of NaCl, sylvite, carnallite (in Solikams, Berezniki, Uoal'e and the Dedyukhin's mines), halite and salts richer in K<sub>2</sub>SO<sub>4</sub>, the content of Br in brines (up to 1500 mg./l. in Ust-Borovskii) and of I (up to 120 mg./l. in Chusovskie Gorodki), and the presence of H<sub>2</sub>S (up to 1000 mg./l.), and of borates, make possible the development of chem. industry in this region. The presence of petroleum (in Chusovskie Gorodki and in Ishimbaevo) and of natural gas, in conjunction with the water resources of the Kama and Volga rivers as a source of hydroelec. power, create exceptional conditions for the development of this region.

Potassium salt deposits. P. I. Prokhorovskii. *Bull. Inst. Metallurg.* 1939, No. 3, 65-75; *Khim. Referat. Zhur.* 1939, No. 6, 88.—The Verkhné-Kama deposits, which contain enormous amts. of carnallite and sylvite, are the best investigated K deposits. They consist almost exclusively of KCl and MgCl<sub>2</sub>. No K<sub>2</sub>SO<sub>4</sub> is present. The Volga-Ural-Bamba deposits are next and, besides KCl, they contain also K<sub>2</sub>SO<sub>4</sub>. The region is little investigated with respect to K. Prospecting work has been done in search for petroleum and B and the data obtained for K are incomplete. The structure of the salt dome is complex. Considerable deposits of polyhalite, kainite, kieserite, bischofite and glaserite were found, besides carnallite and sylvite. The Turkmeniya, Uzbekistan and Tadzhikistan deposits are the least investigated. The K minerals are found there in the form of surface sylvite dispersed in the mass of NaCl. The Central Asia K deposits are of exceptional importance for local cotton growing.

Kirov, Vestnik Oftalmologii, No 3, May/June 57, pp 10-13

The purpose of the present research was to study the clinical picture and treatment of penetrating wounds of the cornea of dogs sick with acute radiation sickness under conditions of delayed surgical treatment.

Three series of experiments were performed on 45 dogs: (1) the healing of penetrating wounds of dogs (controls); (2) the healing of penetrating wounds of dogs irradiated by 300 r from radioactive cobalt, but not treated; and (3) the healing of penetrating wounds of dogs irradiated by 300 r from radioactive cobalt and treated with penicillin. The method of surgical intervention for the application of a corneal suture as suggested by the Central Institute of Blood Transfusion was also investigated.

Results proved that (1) there were no clinically visible differences between the control and irradiated dogs during the latent period of acute radiation sickness in respect to the healing of the penetrating wounds of dogs' cornea; and (2) corneal sutures applied on the third day after the infliction of wounds on irradiated dogs were found to be an effective method for the surgical treatment of this type of combined injury. SUBJECT: USSR/Luminescence

48-4-14/48

AUTHORS: Tolstoy N.A., Tkachuk N.N. and Preobrazhenskiy R.K.

TITLE: Kinetics of Infra-Red Luminescence of cuprous Oxide (Kinetika infrakrasnogo svecheniya zakisi medi)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, 1957, Vol 21, #4, pp 521-522 (USSR)

ABSTRACT: Development of the ultrataumeter made it possible to investigate luminescence kinetics of cuprous oxide.

The study of dependence of luminescence relaxation time  $\tau$  on temperature and content of ultra-stoichiometric oxygen has shown the following:  $\tau$  anomalously increases from  $5 \times 10^{-8}$  to  $5 \times 10^{-6}$  sec with the temperature rise from  $-183^{\circ}\text{C}$ . At the room temperature the  $\tau$ -value ceases to rise and falls at the further heating (temperature quenching).

The increase in oxygen content leads to  $\tau$ -decrease at all temperatures except the lowest.

Card 1/2

TITLE:

Kinetics of Infra-Red Luminescence of cuprous Oxide (Kinetika  
infrakrasnogo svecheniya zakisi medi) <sup>48-4-14/48</sup>

Citing the 3 possible ways of accounting for the  $\tau$ -rise with temperature, the author favors the third one according to which the absorption mechanism bears an excitation character. Exciton decay on a charged acceptor leads to photoconductivity, and on an uncharged acceptor leads to luminescence. Assuming that the cross section of exciton capture is larger for the uncharged acceptor, the total cross section of all exciton capture centers decreases with temperature rise and the  $\tau$ -value of luminescence increases.

The report is followed by a discussion.

~~Summary of infrared spectroscopy~~

sec. At room temp. the values of  $\tau$  for samples of different sizes  $l$  were grouped according to  $l^2$ . At  $10^{-4}$  sec., with a max. of  $1 \times 10^{-3}$  sec. and the lowest of  $0.1 \times 10^{-4}$  sec. With  $\text{Cu}_2\text{O}$  plates split, the values of relaxation time from the cleaved side were constantly greater than those from the other side. The ratio  $\tau_{\text{top}}/\tau_{\text{bot}}$  varied from 1 to 8, with an av. value 2.2. This indicates that an increase in the concn. of O in  $\text{Cu}_2\text{O}$  decreases the  $\tau$ . Etching of crystals with  $\text{HNO}_3$ , which results in a decrease in the O content in the surface layer, produced on the av. 1.5 times increase in the  $\tau$ . At  $-150^\circ$  the  $\tau$  was independent of the O content in the sample, its av. value was  $7.5 \times 10^{-7}$  sec., with the lowest and the highest values  $5 \times 10^{-7}$  sec. and  $10 \times 10^{-7}$  sec., resp. There was no correlation between the results obtained at room temp. and at  $-150^\circ$ . The ratio  $\tau_{\text{top}}/\tau_{\text{bot}}$  for the majority of the cases varied between 15 and 30, occasionally reaching 100 and in few instances it was approx. 1. An elec. field (20 kv./cm.) at low temp. had no effect on the  $\tau$ ; at higher temps. when  $\text{Cu}_2\text{O}$  became electroconductive, the  $\tau$  began to change owing to the presence of a slight Joule effect. At room temp. the ratio of relaxation times before and after annealing of  $\text{Cu}_2\text{O}$  for 4 hrs. at  $300^\circ$  at  $10^{-4}$  mm. pressure was 2.8; after 4 hrs. at  $700^\circ$  in air - 3.5; and when the samples were first annealed in vacuum, cooled, and then heated in the air, it was 4.4.

TITLE: Daurian leafsater (*Galeruca daurica*)

SOURCE: Zashchita rasteniy ot vreditel'ey i bolezney, no. 2, 1965, 50

TOPIC TAGS: agriculture, pesticide, insect

ABSTRACT: Onion plantings have been damaged in recent years by *Galeruca daurica*, previously noted only in the Primorskiy Kray. Beetles and their larvae open holes in the stems or destroy them completely, and larvae foul their interiors with excreta. The beetles are black and yellow, 6-9 mm long; the larvae are black, 25 mm long, with 16 hairy warts on each segment. Their 2-mm eggs are bright yellow and are laid 1-2 cm below ground level. The females cover them with cementing liquid. Larvae are hatched at the end of May and cause mass destruction of the crop at the beginning of June. Pupae are formed 2-4 cm below ground level throughout June. The beetles appear at the end of June and beginning of July. They feed voraciously at first, become inactive during the hot weather, and start feeding heavily again and copulating in the first half of August. Eggs are laid starting at the end of August in 3-4 batches, 6-10 days apart, with each female producing about 200.

Card 1/2

L 45370-65

ACCESSION NR: AP5011974

Chemicals are best applied at the end of May (when the larvae hatch). DDT is most effective, but is applicable only on seedstock; the marketable crop should be treated with pyrethrum. Pupae are destroyed by cultivating in the first half of June, the eggs by fall plowing. Onions should not be planted in the same fields more than twice in succession, and other vegetation on which this pest feeds should be destroyed.

Synthesis of the alkaloid pilosinine. A. M. Polyakova, V. A. Pirobrashenskii and N. A. Pirobrashenskii. *J. Gen. Chem.* (U. S. S. R.) 9, 1402 (1939). Pyman (*C. A.* 7, 978) isolated from *Pilocarpus microphyllus* 0.007% of the alkaloid pilosine (carpine),  $C_{11}H_{15}O_2N_2$ , which when distil. with 20% KOH was decoupled into Brill and an optically active base, named by him

pilosinine (I) and identified as  $CH_3OOC.CH_2.CH(CH_3).$

$C.CH.N.CH.NMe$ . In the first synthesis of I here described Et succinate and  $HCO_2Et$  are with MeONa condensed at 20° to *Et formylsuccinate*; the free ester is reduced with Al-Hg and then distil. to give  $CO_2$  and *Et*

*pilosinate*,  $CH_3OOC.CH_2.CHCO_2Et$ , b. 154°, b. 273-0°; the latter on sapon. with dil. HCl gave the *free acid*, m. 64-5°, b. 203°; its *chloride* (prepl. by heating with excess  $SOCl_2$  at 50-60° for 5 hrs.), b. 107°, when treated with 3 mols.  $CH_3N_2$  in  $H_2O$  at 0° formed *diasomethyl*

*pilosinyl ketone*,  $CH_3O.CO.CH_2.CHCH_2COCHN_2$ ; the reaction mixt. directly introduced into 87 ml. of abs. alc. contg. 2.00 g.  $Ag_2O$  and heated at 80° yielded 70.7% *Et*

*homopilosinate*,  $CH_3OOC.CH_2.CHCH_2CO_2Et$ , b. 161°, m. 1.466, M. R. D. 40.31; the *free acid*, m. 81.3-7.6°, b.

165°; its *chloride*, b. 126°, treated with  $CH_3N_2$  gave *diasomethyl homopilosinyl ketone* (II); this, treated with glacial AcOH at 75°, afforded 84% *acetoxymethyl homopilosinyl ketone*, b. 168°; 4.10 g. of the ketone in 50 ml.  $H_2O$  is treated with 0.2 g.  $Cu(OAc)_2$ , 1 ml. of 10%  $CH_3I$  and 10 ml. of 25%  $NH_4OH$  at 100° for 1 hr. The  $Cu$  is removed with  $H_2S$  and the excess  $H_2S$  with  $N$ , the acidified is extd. with  $Et_2O$ , dissolved in the min. amt. of  $H_2O$ , alkaliized with  $NH_4OH$ , extd. with  $CHCl_3$ , dried with  $Na_2SO_4$ , and the  $CHCl_3$  distil. off *in vacuo*, giving *pilosinamine* (*HCl* salt, m. 117-18°); pilosinamine (1 g.) is treated with 2 ml. MeOH and 0.9 g. MeI in a sealed tube at 50-60° for 2 hrs., the excess of MeOH and MeI is distil. off *in vacuo* at 30-40°, the residue in 5 ml.  $H_2O$  is made strongly alk. with 10 ml. of satd.  $K_2CO_3$ , the soln. is extd. with  $CHCl_3$  and the  $CHCl_3$  is expelled *in vacuo* at 25-30°, giving 70% I (nitrate, m. 168.5-80° (abs. alc.)). I is an oil, sol. in  $H_2O$ , alc.,  $Me_2CO$  and poorly sol. in dry  $Et_2O$ . In the modified procedure II in dry ether is treated with gaseous HCl at 0° for 1 hr. and the ether vacuum-distil., giving 07% *chloromethyl homopilosinyl ketone*, b. 163°; 1.2 g. of the ketone in 10.5 ml. of abs. alc. and 1.45 g.  $CaH_2(CO)_2NK$  is refluxed 8 hrs. and the resulting phthalimide deriv. is decompd. with 20 ml. of 50% HCl by boiling 8 hrs., forming 90% *aminomethyl homopilosinyl ketone* (*HCl* salt, m. 140-3°); refluxing 0.05 g. of the ketone with 0.5 g. KSCN in 2 ml.  $H_2O$  for 8 hrs. yielded 74% pilosinamine-2-thiol, m. 202.5-3°; oxidation with  $FeCl_3$  in  $H_2O$  gave pilosinamine Chas. Blanc

New synthesis of ethylsuccinic (fumaric) acid. A. M. Poljakova  
 and V. A. Buzdakovskaya (J. Gen. Chem., Russ., 1948, 19, 266—  
 269); by hydrogenating under pressure (120 atm. H<sub>2</sub>) in AcOEt and  
 MeOH in presence of both Pd/C and PdO; Et, acrylate-ethyl-  
 succinate (I) is reduced to Et-2-ethyl-3-oxobutanoate-carboxylic  
 acid (II) in 90% yield. The liquid part of  
 C<sub>10</sub>H<sub>16</sub>O<sub>4</sub> (II), m.p. 81°C, b.p. 147°C/2 mm. The liquid part of  
 the solid obtained on cooling (m.p. 97°C) being more stable  
 than (II) is reduced in EtOH-AcOH, and with  
 Raney-Ni in EtOH or EtOH-AcOH gives succinic acid. (II) with heating  
 in EtOH-AcOH gave succinyl-ethyl-succinate acid.  
 C<sub>10</sub>H<sub>16</sub>O<sub>4</sub> (II) was decomposed in EtOH-AcOH at 60°C  
 with NaNO<sub>2</sub> in EtOH-AcOH, and distilling the extract  
 working in EtOH, extraction with Et<sub>2</sub>O, and distilling the extract  
 gave a substance which caused no depression of m.p. on mixing with  
 the isoptopic acid obtained from formylsuccinic acid. R. To.

Preparation of ~~homopolymer~~ V. A. Proobrashenski, A. M. Poljakova, and S. E. Radlov (J. Gen. Chem. Russ., 1962, 12, 818-821).  $-(CH_2)_2(CO-NH_2)_2$  is dehydrated with  $P_2O_5$  and the resultant pure  $(CH_2)_2(CO)_2$  is hydrogenated with Pd-Pt catalyst at room temp. and 50 atm. pressure in presence of EtOH and conc.  $H_2SO_4$ . The acid prevents by-product formation, most of the  $(CH_2)_2(NH_2)_2$  (B) being pptd. as the sulphate, from which it is recovered by treatment with KOH and distillation in vac. A further small amount of (B) is isolated from the hydrogenation solution. Total yield: 80% of theory. L. L.

PREOBRAZHENSKIY V. A.

Chemical reactions at highest pressures and at high temperatures. III. Apparatus for the study of oxidation with compressed oxygen at pressures up to 1500 atmospheres, and some methods of oxidation of organic compounds. I. P. Vereshchagin and V. A. Preobrazhenskii (Inst. Org. Chem., Acad. Sci. U.S.S.R.). Bull. acad. sci. U.R.S.S., Classe sci. chim., 1945, 359-63 (English summary); cf. C.A. 40, 5025<sup>g</sup>.—Glycerol was found to be the most convenient hydraulic liquid in contact with oxygen, preferably in 50% diln. with water (Pure glycerol tends to crystallize in the capillaries at 10° and 1500 atm.). The liquid undergoes slow oxidation and it is therefore necessary to change it frequently. The piston of the compressor is likewise lubricated with a glycerol-water mixt. The reaction vessel is a stainless-steel cylinder of 10 mm. inner diam., 30 mm. outer diam. and 140 mm. high. Cyclohexene (0.5 g.), under 1000 atm., did not show any change in 4 hrs. at 12° and at 50°. At 100°, in 5 hrs., the  $n_D$  of the liquid was somewhat increased, from 1.497 (at 20°) to 1.4518. At 150°, explosion occurred under 1000 atm. within 3 mins. A larger amt. of the cyclohexene, 2.4 g., exploded under 1000 atm. after 1 hr's. heating at 100°. The same amt. of cyclohexene, after being kept in a refrigerator at -5°, exploded after 2 hr's. heating to 50°. The oxidizability of cyclohexene at temp. above 50° depends obviously on the presence of peroxides. Oxygen compressed to 600-1300 atm. shows rapid increase of O<sub>2</sub> absorption bands. It can be extrapolated so that at 3000 atm. and above O consists practically of O<sub>2</sub> mols. only.

TITLE: Preparation of adipic acid by the nitric acid oxidation of  
the products of cyclohexane oxidation in air

PERIODICAL: Khimicheskaya promyshlennost', no. 4, 1962, 7-11

TEXT: To synthesize adipic acid, experiments were conducted at the GIAP, in the nitric acid oxidation of: rectified cyclohexanol (I), crude cyclohexanol (II) consisting of 75% cyclohexanol and 25% X-oil (distillation residue from oxidation of cyclohexane in air), a mixture of 50% cyclohexanol + 50% X-oil (III), and 70% cyclohexanol + 30% X-oil. Reaction was obtained by adding the starting substance dropwise to 57% HNO<sub>2</sub> at 70°C, ratio HNO<sub>3</sub> (100%) : starting substance = 4.5 : 1, pressure 1-7 atm, copper-vanadium catalyst. Of the nitrous gases forming, NO and NO<sub>2</sub> can be regenerated to HNO<sub>3</sub> in the GIAP apparatus at 3.5-7 atm. After adding all the organic starting substance and completing the first state the mixture

## Preparation of adipic acid ...

was heated to 100°C and agitated for 30 mins. Then the product was drained from the vessel, and the adipic acid and lower dicarboxylic acids precipitated at room temperature were filtered off. The more readily soluble lower dicarboxylic acids were removed with distilled H<sub>2</sub>O at 40°C. The mother liquor was analyzed chromatographically for adipic, glutaric, succinic, propionic, and acetic acids. Results: (1) C<sub>6</sub>H<sub>11</sub>OH synthesized from C<sub>6</sub>H<sub>5</sub>OH and from C<sub>6</sub>H<sub>12</sub> yielded equal amounts of adipic acid: 1.29 g per g starting substance, but a larger quantity of other dicarboxylic acids was formed with C<sub>6</sub>H<sub>12</sub>. (2) At 3.5 atm (optimum) the adipic acid yield (g adipic acid per g starting substance) was ~1.42 with I, ~1.36 with II, ~1.13 with III. Nitric acid consumption was insignificant: (g HNO<sub>3</sub> per g adipic acid) 0.85 with I, ~0.87 with II, ~1.08 with III. (3) Saponification of the esters in the X-oil with 16% NaOH (250°C, 55 atm, 30 min) resulted in additional quantities of cyclohexanol and cyclohexanone, the oxidation of which increased the adipic acid total yield (by 0.149 g per g saponified X-oil (total adipic acid yield 0.71 g per g X-oil). The resultant high consumption of HNO<sub>3</sub> is explained by incomplete separation of the hydrocarbon solution and the alkali. The adipic acid obtained from
